

Images & Asset Management Specification

Purpose

Define how images, icons, logos, mockups and media assets should be sourced, optimized and managed so the visual identity remains consistent, authentic and scalable.

Asset Ownership

Framkant Nordic will provide: company logo files (SVG, PNG), brand assets, real client logos (when approved), authentic project screenshots, analytics screenshots, approved testimonials, and any original photography available.

Developer Responsibilities

The developer may source high-quality royalty-free supporting imagery for abstract concepts or layouts, but should not choose hero imagery or client-related visuals without approval.

Authentic Photography

The following must always be authentic where possible: client businesses, team photos, before/after website examples, Google Business Profiles, dashboards, testimonials, case studies and project evidence. Avoid generic corporate stock photography and AI-looking people.

Mockups

Website and mobile device mockups should be generated from actual Framkant Nordic work. Use clean MacBook, desktop and smartphone mockups with minimal branding. Never present fictional results.

Logo Usage

Always use SVG when available. Maintain clear space around logos. Never stretch, distort, recolor or add effects. Client logos should appear in monochrome unless brand guidelines require otherwise.

Icons

Use Lucide Icons as the standard library. Outline style only. Consistent stroke width and Framkant Blue as the primary accent.

Image Formats

Use AVIF where supported with WebP fallback. SVG for logos and icons. PNG only where transparency is required. JPEG only for legacy compatibility.

Compression

Automatically generate responsive image sizes. Compress all raster images while preserving quality. Lazy-load below-the-fold media. Avoid uploading oversized originals directly to pages.

Responsive Images

Support srcset and modern responsive image generation. Every hero image should support desktop and mobile crops with focal-point selection.

Alt Text

Every image must include descriptive alt text. Decorative images should use empty alt attributes. Alt text should describe the content and purpose rather than stuffing keywords.

File Naming

Use descriptive lowercase filenames with hyphens (e.g. local-seo-dashboard.webp). Avoid generic names like image1.jpg.

CMS Fields

Every media item should support: alt text, caption, copyright/source, focal point, mobile crop, featured image flag and replacement without changing URLs where possible.

SEO & Performance

Images must not become the Largest Contentful Paint bottleneck. Preload only critical hero images. Preserve aspect ratios to prevent layout shift.

Acceptance Criteria

All logos render sharply on Retina displays; images are optimized automatically; responsive formats are served; alt text is required for content images; authentic proof is prioritized over decorative visuals; no stock imagery undermines trust.
