

Mobile & Responsive Design Specification

A mobile-first specification for Framkant Nordic. The mobile experience must be deliberately designed, not automatically generated from the desktop layout.

Mobile is a primary conversion environment. For paid traffic, especially Meta Ads, it should be treated as the default experience - not a reduced desktop version.

1. Purpose

This document defines how Framkant Nordic pages, templates, components, forms, timelines, diagrams, cards, images, and calls-to-action should behave across desktop, tablet, and mobile.

The goal is to preserve clarity, trust, speed, and conversion quality on every screen size.

2. Responsive Breakpoints

Viewport	Recommended Range	Primary Behaviour
Mobile	320-767 px	Single-column, touch-first, simplified visuals
Tablet	768-1023 px	One or two columns depending on content
Desktop	1024-1439 px	Full layouts with standard max width
Large Desktop	1440 px and above	Centered content; do not stretch indefinitely

3. Mobile-First Priority

Every page should first be tested as a mobile conversion journey.

The developer should verify:

- The main value proposition is visible without excessive scrolling.
- The primary CTA is visible early.
- Forms are easy to complete with one hand.
- No section depends on hover.
- Text remains readable without zooming.
- Decorative content never pushes essential content too far down the page.

4. Two-Column Sections

Desktop two-column sections should stack vertically on mobile.

Default stacking order:

1. Headline and explanation
2. Primary CTA or key action
3. Supporting image, mockup, diagram, or secondary content

Do not automatically place the image first simply because it appears on the left on desktop. The content priority should determine the mobile order.

Recommended mobile spacing between stacked blocks: 24-32 px.

5. Hero Sections

Desktop heroes may use a 55/45 or 60/40 split. On mobile, use a single-column layout.

Mobile order:

- Eyebrow or category label
- H1
- Supporting paragraph
- Primary CTA
- Secondary CTA or trust note
- Form or visual

Avoid forcing the full hero into one screen. Prioritize a clear message and visible CTA over artificial above-the-fold compression.

6. Forms on Mobile

Forms should use one column only.

Requirements:

- Full-width fields
- Minimum field height: 52-56 px
- Minimum tap target: 44 x 44 px
- Labels above fields; do not rely on placeholders alone
- Correct mobile keyboard types for phone, email, number, and URL fields
- Short qualification forms split into logical groups if necessary
- Primary submit button full width
- Clear inline validation
- No multi-column field rows on narrow screens
- Keep optional fields clearly marked

For long forms, use progressive steps only when it clearly reduces friction. Do not create unnecessary multi-step complexity.

7. Calendar Booking

The booking calendar should be optimized for touch and avoid horizontal scrolling.

On mobile:

- Show one date column or compact date selector
- Use large time-slot buttons
- Keep booking confirmation on the same page where possible
- Preserve UTM and lead-source data through the booking flow
- Avoid opening new tabs unless required by the platform

8. Timelines and Processes

Horizontal desktop timelines should become vertical on mobile.

Recommended mobile format:

- Numbered steps
- Vertical connecting line
- Short title
- One concise explanation per step

Do not use a horizontal swipe carousel for essential process steps. The full process should be visible by scrolling.

9. System Diagrams

Desktop system diagrams may be horizontal. On mobile they should become vertical, simplified, and linear.

Example:

Traffic

Website

CRM

Automation

Follow-Up

Growth

Rules:

- Maximum one main flow per viewport section
- Avoid small labels or dense connector lines
- Use the same component style across all pages
- Optional details may expand beneath each step
- Never require pinch-to-zoom

10. Cards: Grid, List, or Slider

Default rule: essential cards become a vertical list on mobile.

Use vertical lists for:

- Services

- Industries
- Case studies
- Value propositions
- FAQ-related content

Use horizontal sliders only for secondary or supplementary content, such as related articles or related case studies. If a slider is used, show part of the next card so the interaction is obvious.

Do not hide key cards behind a slider.

11. Mobile Typography

Recommended starting sizes:

- H1: 38-42 px, line-height 1.08-1.15
- H2: 30-34 px, line-height 1.15-1.22
- H3: 24-28 px, line-height 1.2-1.3
- H4: 20-22 px
- Body large: 18-20 px
- Body: 17-18 px
- Small text: 14-16 px
- Buttons: 16-17 px, weight 600

Use responsive sizing where appropriate, for example CSS clamp(). Avoid reducing body copy below 16 px.

12. Spacing on Mobile

Recommended spacing:

- Page side padding: 20-24 px
- Section padding: 56-72 px
- Headline to paragraph: 16-20 px
- Paragraph to CTA: 24-32 px
- Card gap: 16-20 px
- Card padding: 24 px
- Form field gap: 16 px

Whitespace should remain generous, but not so large that the page feels unnecessarily long.

13. Images and Cropping

Use responsive image sources and deliberate crops.

Rules:

- Hero images should have dedicated mobile crops where necessary
- Use object-position controls to protect faces, screens, and key subjects
- Avoid shrinking wide desktop screenshots until text becomes unreadable
- Convert detailed dashboards into cropped focus views on mobile
- Decorative images may be hidden if they add length without value
- Proof images, case study results, and trust-building visuals should not be hidden
- Use WebP or AVIF and correct intrinsic dimensions

14. Images That May Be Hidden

Images may be removed on mobile when they are purely decorative, duplicated elsewhere, or delay the main CTA.

Images should remain when they prove results, explain a system, show a real client, demonstrate a website, or build trust.

The developer should not use a blanket 'hide all images on mobile' rule.

15. Navigation and Header

Use a compact sticky mobile header with logo and menu button.

Requirements:

- Height approximately 64-72 px
- Full-screen or large slide-in menu
- Expandable Industries and Services sections
- Primary CTA clearly visible within the menu
- Body scroll locked while menu is open
- Visible close button
- No hover-only interactions

16. CTA Behaviour

Primary CTAs should remain easy to reach throughout the page.

Recommended approach:

- Strong CTA in hero
- CTA after major proof or case study sections
- Final CTA with short form

A sticky bottom CTA may be tested on paid campaign landing pages, but should not be

applied globally without evidence. It must not cover content, cookie controls, or form actions.

17. Tables and Data

Avoid wide tables on mobile.

Preferred alternatives:

- Convert rows into stacked cards
- Show only essential columns
- Allow controlled horizontal scrolling only when comparison integrity requires it
- Freeze the first column when technically reasonable
- Clearly indicate scrollability

18. Galleries and Screenshots

Project galleries should become a vertical image sequence or simple swipe gallery on mobile.

Do not use tiny multi-column thumbnails. Every screenshot should remain large enough to understand. Use captions to explain what the visitor is seeing.

19. FAQ

FAQ accordions should be full width with large tap areas.

Requirements:

- 52-60 px minimum collapsed row height
- Clear plus/minus or chevron indicator
- Smooth but short animation
- Only one or multiple open items depending on content; consistency matters more than either choice

20. Footer

Footer columns should stack into clear groups.

Recommended order:

1. Brand statement and CTA
2. Main navigation
3. Services
4. Industries
5. Contact and social links
6. Legal and company information

Use accordions only if the footer becomes too long. Important contact and legal information must remain immediately accessible.

21. Performance Requirements

Mobile performance is a conversion requirement.

Targets:

- Mobile PageSpeed score: 85+ as a practical minimum, with 90+ as the target
- Core Web Vitals in the green range
- Lazy-load below-the-fold media
- Preload only critical assets
- Avoid heavy animation libraries
- Limit third-party scripts
- Use compressed responsive images
- Prevent layout shift by reserving image and embed dimensions

22. Accessibility

All mobile components must support:

- Keyboard navigation where relevant
- Screen readers
- Visible focus states
- Sufficient contrast
- 44 x 44 px minimum touch targets
- Labels for icons and menu controls
- Reduced-motion preferences
- Logical reading order after stacking

23. Paid Traffic Landing Pages

Industry pages used for Meta Ads should be reviewed separately on mobile.

Priorities:

- Message match between ad and hero
- Short load time
- Immediate industry relevance
- Visible CTA within the first meaningful screen
- Reduced navigation distractions where appropriate
- Short form or direct booking option
- Trust proof before the visitor is asked for extensive information
- Accurate tracking of campaign, ad set, and creative through UTM parameters

24. Component Behaviour Matrix

Component	Desktop	Tablet	Mobile
Two-column section	Two columns	Two or stacked	Stacked by content priority
Service cards	3 columns	2 columns	1-column list
Industry cards	2 columns	2 or stacked	1-column list
Case studies	3-column grid	2-column grid	1-column list
Timeline	Horizontal	Horizontal or vertical	Vertical
System diagram	Horizontal	Simplified	Vertical
Form	1-2 columns	1 column preferred	1 column
Gallery	Grid or feature layout	2 columns	Vertical or swipe
Related content	3 cards	2 cards	List or optional slider

25. Testing Requirements

The developer should test key pages at minimum on widths of 320, 375, 390, 430, 768, 1024, 1280, and 1440 px.

Test in current Chrome, Safari, Edge, and mobile Safari/Chrome environments. Forms, menus, calendars, sliders, and tracking should be tested on real mobile devices where possible.

26. Acceptance Criteria

- No horizontal page scrolling occurs at supported viewport widths.
- All essential content is available without hover.
- Two-column sections stack in a deliberate and logical order.
- Forms are one-column, touch-friendly, and easy to complete.
- Timelines and system diagrams remain understandable on small screens.
- Essential cards are not hidden inside sliders.
- Text remains readable without zooming.
- Images use deliberate crops and do not become unreadable.
- The primary CTA appears early and again after major proof sections.
- Mobile performance and Core Web Vitals are treated as launch criteria.

- Paid-traffic landing pages are reviewed independently on mobile.

27. Version One Recommendation

For the first release, prioritize stable single-column mobile layouts, vertical cards, vertical timelines, simplified diagrams, and short forms. Avoid adding mobile sliders, sticky CTA bars, complex interactions, or custom breakpoint exceptions unless there is a clear conversion reason.
