

Technical Quality Standards Specification

Purpose

Define the minimum technical quality standards for the Framkant Nordic website. These requirements are mandatory for launch and should be treated as acceptance criteria, not optional improvements.

Core Web Vitals

Meet Google's Core Web Vitals on both desktop and mobile. Target: LCP under 2.5 seconds, INP under 200 ms, CLS below 0.10.

Performance

Target PageSpeed Insights score: 90+ on desktop and 85+ on mobile as a minimum, with 90+ on both as the long-term goal. Minimize render-blocking resources and unnecessary JavaScript.

Accessibility

Build with accessibility from the beginning. Follow semantic HTML, meaningful landmarks, accessible forms and descriptive labels.

WCAG Compliance

Minimum target: WCAG 2.2 AA. All templates and reusable components should meet this standard.

Keyboard Navigation

All interactive elements must be reachable and usable using only a keyboard. Visible focus states are required.

Color Contrast

Meet WCAG AA contrast requirements for text, buttons, forms, links and icons. Never rely on color alone to communicate meaning.

Lazy Loading

Lazy-load all below-the-fold images, videos and iframes. Do not lazy-load above-the-fold hero content or the primary LCP image.

Image Optimization

Serve responsive AVIF/WebP images, generate multiple sizes automatically, compress images without visible quality loss and preserve aspect ratios to prevent layout shifts.

Security

Use HTTPS everywhere, secure headers where applicable, automatic updates, least-privilege permissions, spam protection for forms and protection against common vulnerabilities.

Backups

Automatic daily backups with at least 30-day retention. Support one-click restoration and off-site backup storage.

Staging Environment

Maintain separate Development, Staging and Production environments. Changes should be tested and approved in staging before deployment.

Cookie Consent

Implement GDPR-compliant cookie consent with granular categories (Necessary, Analytics, Marketing). Tracking scripts must respect user consent.

Browser Testing

Test current versions of Chrome, Edge, Safari and Firefox on desktop, plus Safari (iOS) and Chrome (Android). Validate common viewport widths and touch interactions.

Responsive QA

Verify all templates on mobile, tablet and desktop. No horizontal scrolling, broken layouts or inaccessible controls.

SEO Validation

Confirm metadata, structured data, canonical tags, sitemap, robots.txt and Open Graph before launch.

Monitoring

Integrate Google Search Console, Google Analytics 4 and uptime monitoring. Log JavaScript errors where practical.

Acceptance Criteria

The website launches only after passing performance, accessibility, responsive, security and browser testing. Critical issues must be resolved before production deployment.
