

# Technical SEO Specification

## Purpose

This specification defines the technical SEO requirements that every page, template and future feature of the Framkant Nordic website must follow. SEO should be built into the architecture from day one.

## URL Structure

Use clean, lowercase URLs with hyphens only. Examples: /services/, /services/local-seo/, /industries/beauty/, /case-studies/, /resources/. Avoid query parameters for permanent content.

## Title & Meta Description

Every page must have editable title and meta description fields in the CMS. Titles should be unique. Meta descriptions should be unique and support click-through rate.

## Canonical Tags

Every indexable page must output a self-referencing canonical tag. Paginated content and duplicates must reference the preferred canonical URL.

## Schema Markup

Implement Organization, WebSite, BreadcrumbList, Service, Article, FAQPage and LocalBusiness (when appropriate). Case studies should use Article schema with additional structured properties where relevant.

## Breadcrumbs

Display breadcrumbs on service pages, industry pages, resources and case studies. Output BreadcrumbList schema.

## Internal Linking

Every page should naturally link to related services, industries, resources and case studies. No orphan pages. Keep crawl depth under three clicks where possible.

## XML Sitemap

Automatically generate XML sitemaps for pages, services, industries, resources and case studies. Exclude noindex pages and redirects.

## robots.txt

Allow crawling of public content. Block admin, staging, search parameters and unnecessary system paths. Include sitemap location.

## Open Graph & Social

Editable Open Graph title, description and image for every page. Include Twitter/X card metadata.

## Article SEO

Resources must support author, published date, modified date, reading time, featured image and Article schema.

## **FAQ Schema**

FAQPage schema should only be applied where visible FAQ content exists.

## **Case Study Structure**

Unique URL, title, meta description, hero image, structured headings, internal links, testimonial, related services and related case studies.

## **Redirects**

Use permanent (301) redirects when URLs change. Maintain a redirect log. Avoid redirect chains.

## **Indexing Rules**

Filter URLs, tag archives, search results and duplicate parameter pages should be noindex unless there is a strategic SEO reason. Main category pages remain indexable.

## **Performance & Crawlability**

Pages must meet Core Web Vitals, use lazy loading, compressed images, descriptive alt text and semantic HTML. Prevent duplicate content and unnecessary JavaScript rendering.

## **CMS Requirements**

Editors must be able to edit SEO title, meta description, canonical override (if needed), Open Graph fields, robots directives and structured FAQ content without developer assistance.

## **Acceptance Criteria**

All templates output valid metadata; structured data validates; XML sitemap updates automatically; breadcrumbs work; no orphan pages; no broken internal links; redirects preserved; pages are ready for Google Search Console indexing.
